The Honorable Julie Morrison, Chair
The Honorable Laura Fine, Vice-Chair
Senate Insurance Committee
705 Stratton Building
Springfield, IL 62706

RE: SB 40

Dear Senators Morrison and Fine:

On behalf of the American Speech-Language-Hearing Association (ASHA), I write to express support for Senate Bill 40, which would require insurance plans to include coverage for habilitative and rehabilitative speech therapy as a treatment for stuttering regardless of whether the stuttering is classified as developmental or due to a definable illness or injury.

ASHA is the national professional, scientific, and credentialing association for 234,000 members, certificate holders, and affiliates who are audiologists; speech-language pathologists (SLPs); speech, language, and hearing scientists; audiology and speech-language pathology assistants; and students. Over 10,100 ASHA members reside in Illinois.¹

We strongly agree with the provisions this bill puts in place to ensure that stuttering therapy services are not subject to 1) maximum annual benefit or visit limits; 2) limitations based on the underlying cause of stuttering; or 3) unnecessary utilization management or prior authorization requirements that could severely limit access to stuttering therapy. We also support coverage of speech therapy services provided via telehealth. Studies have shown high levels of patient, clinician, and caregiver satisfaction supporting telehealth as an effective model for delivery of care.^{2,3}

Stuttering is an interruption in the flow of speaking characterized by specific disfluencies. Stuttering also includes negative reactions to speaking, avoidance behaviors, secondary mannerisms, and physical tension. People who stutter may also experience psychological, emotional, social, and functional reactions to stuttering (anxiety, embarrassment, avoidance, tension and struggle, low self-esteem). As a result, they may speak less and avoid social situations.⁴

SLPs play a central role in assessing and treating fluency disorders, including stuttering. It is important to note that stuttering is not limited to disfluencies and intervention does not focus solely on increasing fluency. SLPs are trained to address disfluencies as well as the negative reactions to speaking, avoidance of speaking, and secondary mannerisms with a goal of reducing disfluencies and increasing comfort and confidence in speaking. Clients often report successful stuttering therapy as a transformational experience progressing from avoidance to acceptance and openness, increasing self-confidence, and self-efficacy.⁵ ASHA urges you to support this legislation to ensure your constituents have access to medically necessary speech therapy services provided by SLPs. If you or your staff have

any questions, please contact Doanne Ward-Williams, ASHA's senior director of state affairs, at dwardwilliams@asha.org.

Sincerely,

A. B. Mayfield-Clarke, PhD, CCC-SLP
2025 ASHA President
